O_3	Ozone
PAMS	Photochemical Assessment Monitoring Station
Pb	Lead
$PM_{2.5}$	Particulate matter with a diameter less than or equal to 2.5 micrometers
PM_{10}	Particulate matter with a diameter less than or equal to 10 micrometers
$PM_{10-2.5}$	Particulate matter with a diameter less than or equal to 10 micrometers, and greater than or equal to 2.5 micrometers
ppb	parts per billion
ppm	parts per million
PQAO	Primary Quality Assurance Organization
PSD	Prevention of Significant Deterioration
PTFE	Polytetrafluoroethylene
PWEI	Population Weighted Emissions Index
QA	Quality Assurance
SWOAQA	Southwest Ohio Air Quality Agency
SASS	Speciation Air Sampling System
SHARP	Synchronized Hybrid Ambient Real-time Particulate
SLAMS	State or Local Air Monitoring Stations
SO_2	Sulfur Dioxide
SPM	Special Purpose Monitor

STN $PM_{2.5}$	Speciation Trends Network
TPY	Tons per Year
TSP	Total Suspended Particulate
TEOM	Tapered Element Oscillating Microbalance
ug/m^3	micrograms per cubic meter
U.S.EPA	United States Environmental Protection Agency
UV	Ultraviolet
VOC	Volatile Organic Compounds
VSCC	Very Sharp Cut Cyclone

Introduction

In October 2006, U.S.EPA issued final regulations concerning state and local agency ambient air monitoring networks. These regulations require states to submit an annual monitoring network review to U.S.EPA. This network plan is required to provide the framework for establishment and maintenance of an air quality surveillance system and to list any changes that are proposed to take place to the current network during the 2013 season.

Public Review and Comment

The annual monitoring network plan must be made available for public inspection for 30 days prior to submission to U.S.EPA. Information on how to comment on the plan and any comments received are listed in Appendix A.

Indiana's Air Monitoring Network

IDEM regulates air quality to protect public health and the environment in the State of Indiana. Air monitoring data are required by regulation and are used to determine compliance with U.S.EPA's NAAQS. Other important uses of the air monitoring data includes, the production of a daily AQI report, daily air quality forecast report, support of short and long-term health risk assessments, identification of a localized health concern, and tracking long-term trends in air quality. Indiana monitors the six criteria pollutants which have NAAQS identified for them; CO, lead, NO_2, O_3, particulate matter (PM_{10} and $PM_{2.5}$), and SO_2. Other pollutants which do not have an ambient standards established for them are also monitored; toxics (VOCs), metals, carbonyls, $PM_{2.5}$ speciated compounds, and ozone precursors. In addition, meteorological data are also collected to support the monitoring and aid in analysis of the data.

Air Quality Data

IDEM presents two different types of air quality data, intermittent and continuous on IDEM's Internet website http://www.in.gov/idem/4652.htm. Annual and quarterly summary reports of pollutants collected by manual methods are available as well as hourly values from continuous monitors. LEADS provides on-line access to Indiana's continuous air quality monitoring network. It has been available to the public since July, 2007. LEADS offers access to near real-time data from 60 continuous air monitoring sites across Indiana. This allows anyone to track pollutant and meteorological values throughout the day. In addition, past data back to 1998 are available as raw data and canned summary reports or user specified retrievals. Plans are underway to add intermittent data to LEADS, bringing all data into one system.

Overview of Monitored Parameters

Criteria Pollutants

Carbon Monoxide (CO)

CO is a poisonous gas that, when introduced into the bloodstream, inhibits the delivery of oxygen to body tissue. The health risk is greatest for individuals with cardiovascular disease.

Lead (Pb)

Lead is a metal that is highly toxic when ingested or inhaled. It is a suspected carcinogen of the lungs and kidneys and has adverse effects on cardiovascular, nervous, and renal systems.

Nitrogen Dioxide (NO_2)

NO_2 is a highly toxic, reddish brown gas that is created primarily from fuel combustion in industrial sources and vehicles. It creates an odorous haze that causes eye and sinus irritation, blocks natural sunlight, and reduces visibility.

Ozone (O_3)

Ground-level O_3, or photochemical smog, is not emitted into the atmosphere as ozone, but rather is formed by the reactions of other pollutants. The primary pollutants entering into this reaction, VOCs and oxides of nitrogen, create ozone in the presence of sunlight. Ozone is a strong irritant of the upper respiratory system and also causes damage to crops.

Particulate Matter (PM_{10})

Particulate matter with a mean diameter of 10 microns or less is emitted from transportation and industrial sources. Exposure to particle pollution is linked to a variety of significant health problems ranging from aggravated asthma to premature death in people with heart and lung disease.

Fine Particulate Matter ($PM_{2.5}$)

Fine particulate matter with a diameter of 2.5 microns or less is created primarily from industrial processes and fuel combustion. These particles are breathed deeply into the lungs. Exposure to particle pollution is linked to a variety of significant health problems ranging from aggravated asthma to premature death in people with heart and lung disease.

Sulfur Dioxide (SO_2)

SO_2 is a gaseous pollutant that is emitted primarily by industrial furnaces or power plants burning coal or oil containing sulfur. At high concentrations, breathing can be impaired. Damage to vegetation can also result.

Non Criteria Parameters

$PM_{2.5}$ Speciation

U.S.EPA implemented the $PM_{2.5}$ chemical speciation monitoring program. Knowing the chemical composition of the $PM_{2.5}$ mix is important for determining sources of pollution and links between observed health effects. The basic objective of speciation analysis is to develop seasonal and annual chemical characterizations of ambient particulates across the nation. This speciation data will be used to perform source attribution analyses, evaluate emission inventories and air quality models, and support health related research studies and regional haze assessments.

The speciation samplers use different inlet tubes and filters to collect the components of the $PM_{2.5}$ mixture. The process consists of using three different types of filters to separate out such specific

compounds as: sulfate, nitrate, organic and elemental carbon, ammonium, metals, and certain ions.

Photochemical Assessment Monitoring Station, PAMS (Ozone Precursors)

Of the six criteria pollutants, O_3 is the most encompassing. The most prevalent photochemical oxidant and an important contributor to "smog," O_3 is unique among the criteria pollutants because it is not emitted directly into the air. Instead, it results from complex chemical reactions in the atmosphere between VOCs and NO_x in the presence of sunlight. There are thousands of sources of VOCs and NO_x located across the country. To track and control O_3, U.S.EPA is trying to create an understanding of not only the pollutant itself, but the chemicals, reactions, and conditions that contribute to its formation as well. Because of this, U.S.EPA called for improved monitoring of O_3 and its precursors, VOC and NO_x, to obtain more comprehensive and representative data on O_3 air pollution. U.S.EPA initiated the PAMS program in February 1993. The PAMS program requires the establishment of an enhanced monitoring network in all O_3 nonattainment areas classified as serious, severe, or extreme. Details of what compounds are sampled are found in the Parameter Networks section.

Toxics / Carbonyls / Metals

Toxic air pollutants, also known as hazardous air pollutants, are those pollutants that are known or suspected to cause cancer, other serious health effects, or adverse environmental conditions. Air toxics include: semi-volatile and volatile organic compounds (VOC), metals, and carbonyls.

Air toxic compounds are released from many different sources, including mobile sources (vehicles), stationary industrial sources, small area sources, indoor sources (cleaning materials, etc.), and other environmental sources (wildfires, etc.). The lifetime, transportation, and make-up of these pollutants are affected by weather and landscape. They can be transported far away from the original source, or be caught in rain and brought down to waterways or land.

The air toxics, carbonyls, and metals are divided into separate categories due to different sampling and analytical methodologies used for each. With all three categories combined, more than eighty different pollutants are analyzed.

Meteorological Monitoring

Any study of air pollution should include an analysis of the weather patterns (meteorology) of the local area because the fate of air pollutants is influenced by the movement and characteristics of the air mass into which they are emitted.

If the air is calm and pollutants cannot disperse, then the concentration of these pollutants will build up. Conversely, if a strong and turbulent wind is blowing, the pollutant will rapidly disperse into the atmosphere and will result in lower concentrations near the pollution source.

The measurements of wind speed and direction, temperature, humidity, rainfall, barometric pressure, ultraviolet radiation and solar radiation are important parameters used in the study of air quality monitoring results, and to further understand the chemical reactions that occur in the atmosphere. Meteorological monitoring is used to predict air pollution events, high pollutant concentration days and to simulate and predict air quality using computer models.

NCore Monitoring

NCore is a multi-pollutant approach to monitoring. NCore sites are intended to support multiple objectives with a greater emphasis on assessment, research support and accountability than the traditional NAMS/SLAMS networks. NCore provides an opportunity to address new directions in monitoring and begin to fill measurement and technological gaps that have accumulated in the networks. Indiana is required to establish and operate one urban NCore site. These sites are required to measure $PM_{2.5,}$ speciated $PM_{2.5}$, $PM_{10-2.5}$, O_3, SO_2, CO, NO, NO_y, Pb, and meteorology.

National Ambient Air Quality Standards (NAAQS)

NAAQS are identified for the criteria pollutants; CO, Pb, NO_2, O_3, particulate matter (PM_{10} and $PM_{2.5}$), and SO_2. Measuring pollutant concentrations in outdoor air and comparing the measured concentrations to corresponding standards determine ambient air quality status of an area, attainment or nonattainment.

The NAAQS are broken down into primary and secondary standards. Primary standards are those established to protect public health. Secondary standards are those established to protect the public welfare from adverse pollution effects on soils, water, vegetation, manmade materials, animals, weather, visibility, climate, property, and economy.

The scientific criteria upon which the standards are based are reviewed periodically by U.S.EPA, which may reestablish or change the standards according to its findings. Note that there are hundreds of compounds that are generally considered pollutants when found in ambient air but whose health and welfare effects are not well enough understood for ambient standards to be defined.

A pollutant measurement that is greater than the ambient air quality standard for its specific averaging time is called an exceedance. This is not necessarily a synonym for a violation; for each pollutant there are specific rules about how many exceedances are allowed in a given time period before a pattern of exceedances is considered a violation of the NAAQS that may result in regulatory actions to further clean up the area's air. This distinction is made to allow for certain limited exceedances of the standard that may occur, for example, during an unusual weather pattern, reserving regulatory action for cases where the exceedances are too large or too frequent.

The design value for a site is the level of pollutant concentration when the rules of the NAAQS calculations are applied to that specific pollutant. For example, the O_3 design value is calculated by taking the three year average of the annual fourth highest daily 8-hour maximums. If this number is above the NAAQS for O_3, then it is a violation or 'nonattainment' of the NAAQS. If the design value is below the NAAQS then the area is in 'attainment' of the standard. Generally, nonattainment is based on the highest design value reported for a specific geographic area (usually an MSA), and the entire area would be defined by that monitor, and would be classified accordingly. This number basically tells you how polluted an area would be in relation to a NAAQS. A listing of the NAAQS can be found at: http://epa.gov/air/criteria.html

5-Year Network Assessment

U.S.EPA requires a Network Assessment be performed every five (5) years, as per 40CFR Part 58.10(d). The first Network Assessment has been approved by U.S.EPA. The Lake Michigan Air Directors Consortium, LADCO published "Regional Network Assessment" for the states of Illinois, Indiana, Michigan, Minnesota, Ohio, and Wisconsin, July 1, 2010. The report is available at http://www.ladco.org/reports/general/Regional_Network_Assessment/index.php
Indiana uses the recommendations from the Assessment as an input into the Annual Network Review Process.

New U.S.EPA Monitoring Requirements

Several of the NAAQS and the monitoring requirements for the various pollutants have either been revised recently, are in the final review stages prior to promulgation, or are planning to have proposals within the next year. Even though IDEM is aware of these proposals and how they could possibly affect Indiana's monitoring network, only those requirements which have been approved and are in effect at this time are considered when modifying Indiana's current network.

Network Overview

Indiana has reviewed its current ambient air quality network and developed a proposed network to be implemented during 2013. Current NAAQS, data trends, site redundancy, siting problems, site access concerns, and other identified monitoring issues all contribute to any proposed network revisions.

The number of sites listed in the current monitoring network includes changes planned to have occurred during 2011 and were not, but are planned, or have been completed during 2012. These include the establishment of the Hamilton County site for $PM_{2.5}$, and the relocation of the Granger O_3 site.

One unplanned site discontinuation occurred in 2012 due to the Kokomo Fire Station no longer granting access to their building. The $PM_{2.5}$ site will be relocated.

Indiana's air monitoring network for 2013 consists of the sites and monitors listed in Table 1. All site changes which have occurred or plan to take place in 2012 are included along with the planned network modifications for 2013. Figure 1 is an overview of Indiana's current monitoring network and shows the locations where some form of monitoring takes place in 2013.

Overall, the number of monitoring locations operated by the State is planned to decrease from 81 sites to 80 sites. The number of monitored parameters or monitoring systems will increase by one to 189.

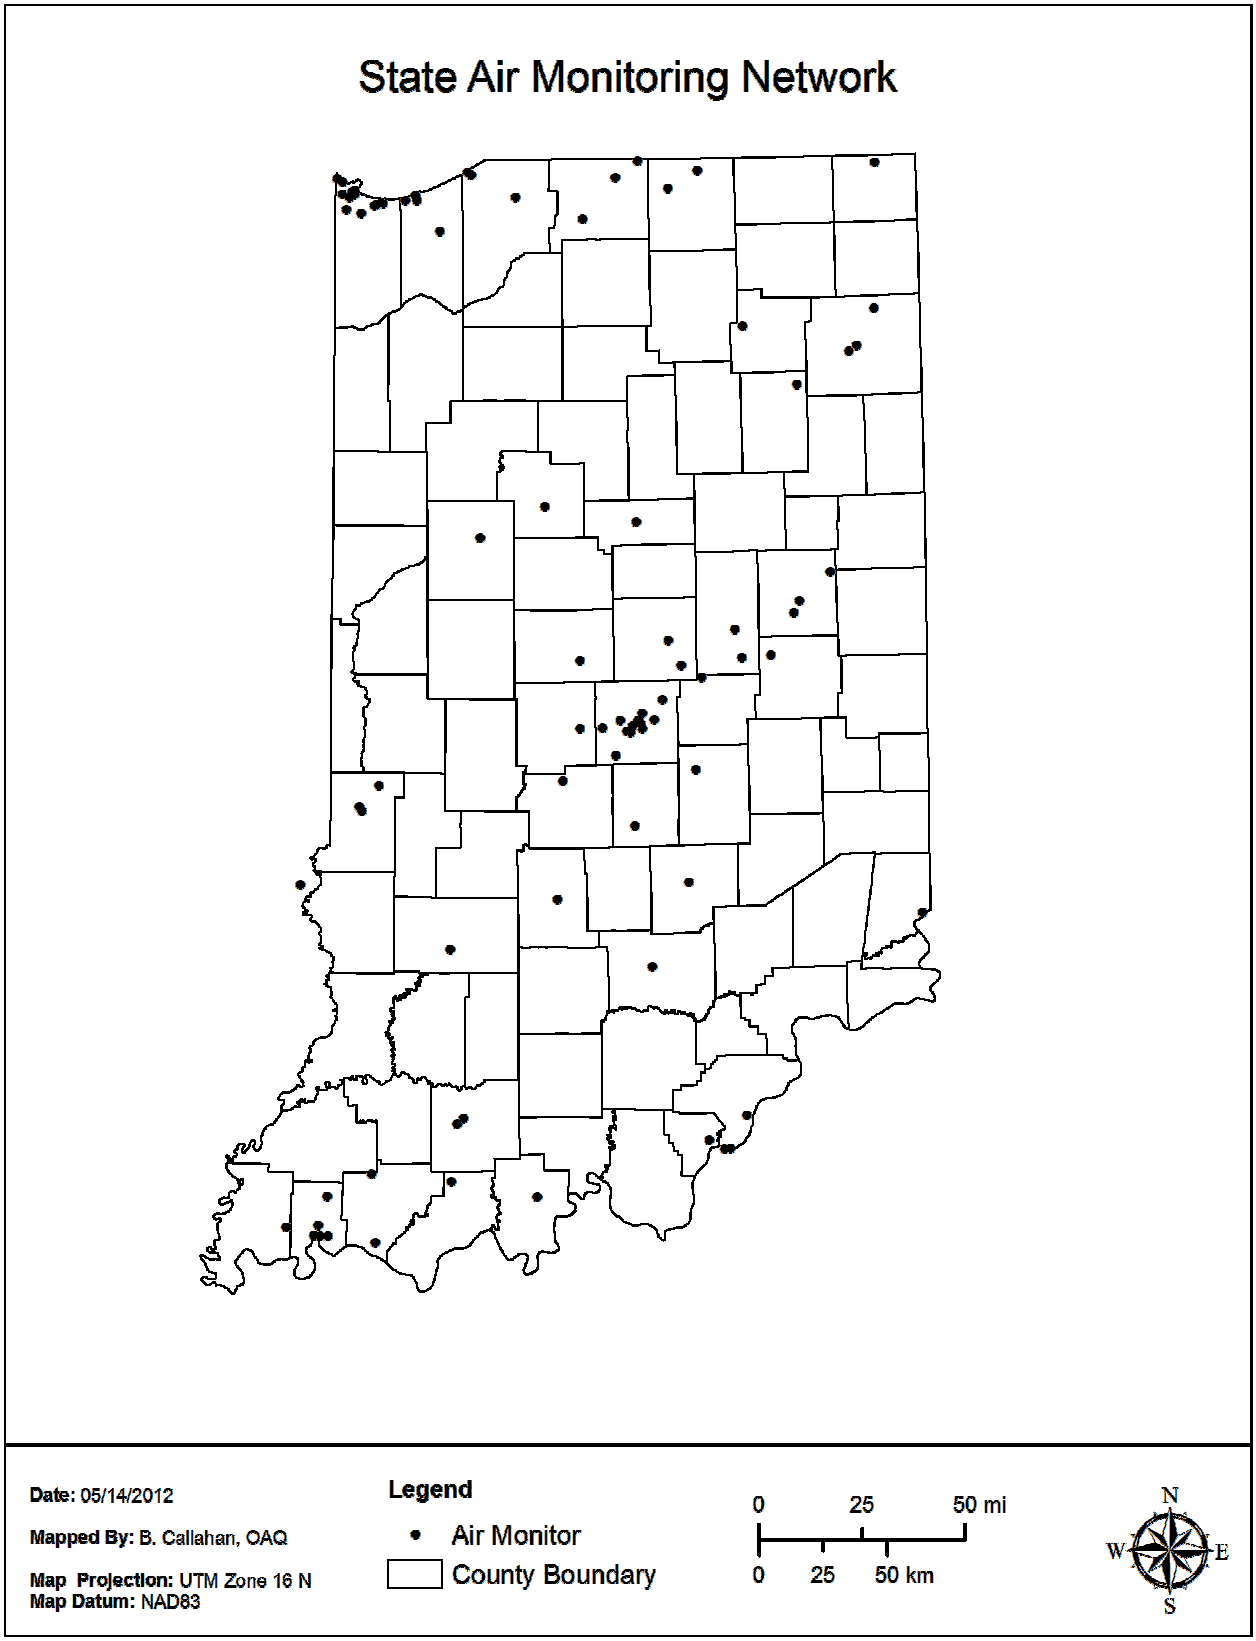
Figure 1 – State Air Monitoring Network 2013



Review Summary

Unanticipated changes made to the 2012 Monitoring Network are:

- Relocation of the Kokomo Fire Station $PM_{2.5}$ monitor.
- Continuation of the search for a $PM_{2.5}$ site to replace the Evansville - Post Office site. The Post Office site was an unplanned site discontinuation in 2011 due to the building closing.

The changes proposed for the 2013 Monitoring Network are:

- Addition of SO_2, and NO_2 to Larwill.
- Addition of SO_2, and NO_2 to Columbus.
- Discontinuation of Boonville O_3.
- Add O_3 at Columbus.
- Discontinuation of $PM_{2.5}$, and PM_{10} at Hammond - Clark High School.
- Discontinuation of Indpls - Drover St. PM_{10}
- Relocation of Indpls - Drover St. PM_{10} collocated to Indpls - West St.
- Relocation of Lafayette - Greenbush St. toxics to Terre Haute.

Network Description

As per 40 CFR Part 58.10, an annual monitoring network plan which provides for the establishment and maintenance of an air quality surveillance system consisting of the air quality monitors in the state, is required to be submitted by all states to U.S.EPA.

Specifically §58.10 (a) requires for each existing and proposed monitoring site:

1. A statement of purpose for each monitor.
2. Evidence that siting and operation of each monitor meets the requirements of appendices A, C, D, and E of 40 CFR Part 58, where applicable.
3. Proposals for any State and Local Air Monitoring station (SLAMS) network modifications.

§58.10 (b) requires the plan must contain the following information for each existing and proposed site:

1. The Air Quality System (AQS) site identification number.
2. The location, including street address and geographical coordinates.
3. The sampling and analysis method(s) for each measured parameter.
4. The operating schedules for each monitor.
5. Any proposals to remove or move a monitoring station within a period of 18 months following plan submittal.
6. The monitoring objective and spatial scale of representativeness for each monitor.
7. The identification of any sites that are suitable and sites that are not suitable for comparison against the annual $PM_{2.5}$ NAAQS as described in §58.30.
8. The Metropolitan Statistical Area (MSA), Core Based Statistical Area (CBSA), Combined Statistical Area (CSA) or other area represented by the monitor.
9. The designation of any Pb monitors as either source-oriented or non-source-oriented according to Appendix D to 40 CFR part 58.
10. Any source-oriented monitors for which a waiver has been requested or granted by the U.S.EPA Regional Administrator as allowed for under paragraph 4.5(a)(ii) of Appendix D to 40 CFR part 58.
11. Any source-oriented or non-source-oriented site for which a waiver has been requested or granted by the U.S.EPA Regional Administrator for the use of Pb-PM_{10} monitoring in lieu of Pb-TSP monitoring as allowed for under paragraph 2.10 of Appendix C to 40 CFR part 58.

Network Review Description

The following definitions represent some of the categories found in the Network Review:

- **Monitor Type** – The name of the designated network:
  - PAMS – *Photochemical Assessment Monitoring Station*: Sites established to obtain more comprehensive data of areas with high levels of ozone pollution by also monitoring NO_x and VOCs.
  - SLAMS - *State or Local Ambient Monitoring Station*: The SLAMS make up the ambient air quality monitoring sites that are primarily needed for NAAQS comparisons. U.S.EPA must approve all SLAMS sites.
  - STN – *$PM_{2.5}$ Speciation Trends Network*: A $PM_{2.5}$ speciation station designated to be part of the speciation trends network. This network provides chemical species data of fine particulates.
  - Supplemental Speciation - Any $PM_{2.5}$ speciation station that is used to gain supplemental data and is not dedicated as part of the speciation trends network.
  - SPM – *Special Purpose Monitor*: Any monitor included in the agency's network that does not count when showing compliance with the minimum requirements of this subpart and for siting monitors of various types.
  - NCore – *National Core multi-pollutant monitoring station*: Sites that measure multiple pollutants at trace levels in order to provide support to integrated air quality management data needs. There is currently one NCore site for Indiana located in Indianapolis.
  - QA Collocated – An audit monitor that is located adjacent to another monitor of the same type used to report air quality for the site. The audit monitor is used solely for Quality Assurance purposes.
  - Non-regulatory – Monitors that are measuring criteria pollutants that are not intended to provide data for regulatory purposes.
  - Index – Monitors that are measuring criteria pollutants that are used to determine the Air Quality Index (AQI) for a known area.
  - Near-Road – Monitors that measure near road peak hourly NO_2 or CO concentrations in larger urban areas.

Operating Schedule - specifies how often a sample is taken.
- Continuous - operates 24/7; applies mainly to gaseous analyzers, although some particulate samplers (TEOM/FDMS, SHARP, and BAMs) operate continuously.
- Daily – a sample is taken every day; applies to manual method particulate samplers.
- 3 - Day - Manual method particulate samplers that run every third day.
- 6 - Day - Manual method particulate samplers that run every sixth day.

Sampling Method – Each ambient air monitor is classified by a specific method number. This method combines both the collection procedure along with the analysis performed on the sample. These numbers can be found in the U.S.EPA "List of Designated Reference and Equivalent Methods" (see U.S.EPA Transfer Technology Network web page at:
http://www.epa.gov/ttn/amtic/files/ambient/criteria/reference-equivalent-methods-list.pdf

Scale – The specific "spatial scales of representation" describes the physical dimensions of the air parcel around the monitoring station throughout which actual pollutant concentrations are reasonably similar.
- Microscale - Areas ranging from several meters to about 100 meters,
- Middle scale - Areas ranging from 100 meters to 0.5 kilometers,
- Neighborhood - 0.5 to 4.0 kilometers, and uniform land use,
- Urban scale - 4 to 50 kilometers, and
- Regional - 50 to hundreds of kilometers.

Monitoring Objective – Describes the purpose/objective for monitoring at a site.
- General/Background concentration – sites located to determine general background concentration levels
- Highest concentration – sites located to determine the highest concentrations expected to occur in the area covered by the network

° Maximum Precursor Emissions Impact – sites where the magnitude and type of precursor emissions in the area are expected to impact. These sites are suited for the monitoring of urban air toxic pollutants.
° Population exposure – sites located to measure typical concentrations in areas of high population density
° Quality assurance – sites where two monitors of the same type are located; one used to report air quality for the site, the other dedicated as an audit monitor
° Regional transport – sites located to determine the extent of regional pollutant transport among populated areas; and in support of secondary standards
° Source-oriented – sites located to determine the impact of significant sources or source categories on air quality
° Upwind background – sites established to characterize upwind background and transported ozone and its precursor concentrations into an area

NAAQS Comparable – 40 CFR Part 58 Appendix B requires the identification of any sites that are suitable or not suitable for comparison against the Annual $PM_{2.5}$ NAAQS as described in Section §58.30. If a 'No' is present in this category this site is located close to a localized hot spot and can only be compared to the 24-hour $PM_{2.5}$ NAAQS, not the Annual $PM_{2.5}$ NAAQS.

MSA – MSAs are defined by the U.S Office of Management and Budget as geographical areas having a large population nucleus and a high degree of economic and social integration with the nucleus. In Indiana, MSAs are either one county or a group of counties. Figure 2 is a map of the MSAs in Indiana. Several border areas are included with other counties in bordering states.

Site Change Proposed – Designates whether this particular site is being considered for some type of modification during 2013; relocation, discontinuation, or addition.

Monitoring Requirements

Appendix A of 40 CFR Part 58 outlines the Quality Assurance Requirements for SLAMS, SPMs, and PSD Air Monitoring. It details the calibration and auditing procedures used to collect valid air quality data, the minimum number of collocated monitoring sites, the calculation used for data quality assessments, and the reporting requirements. All sites in Indiana operate following the requirements set forth in this appendix.

Appendix C of 40 CFR Part 58 specifies the criteria pollutant monitoring methods which must be used in SLAMS and NCore stations. All criteria pollutant monitoring in Indiana follows the methods specified in this appendix.

Appendix D of 40 CFR Part 58 deals with the network design criteria for ambient air quality monitoring. The overall design criteria, the minimum number of sites for each parameter, the type of sites, the spatial scale of the sites, and the monitoring objectives of the sites are detailed. In designing the air monitoring network for Indiana, the requirements of this appendix were followed. The specifics for each pollutant network are in the individual parameter chapters.

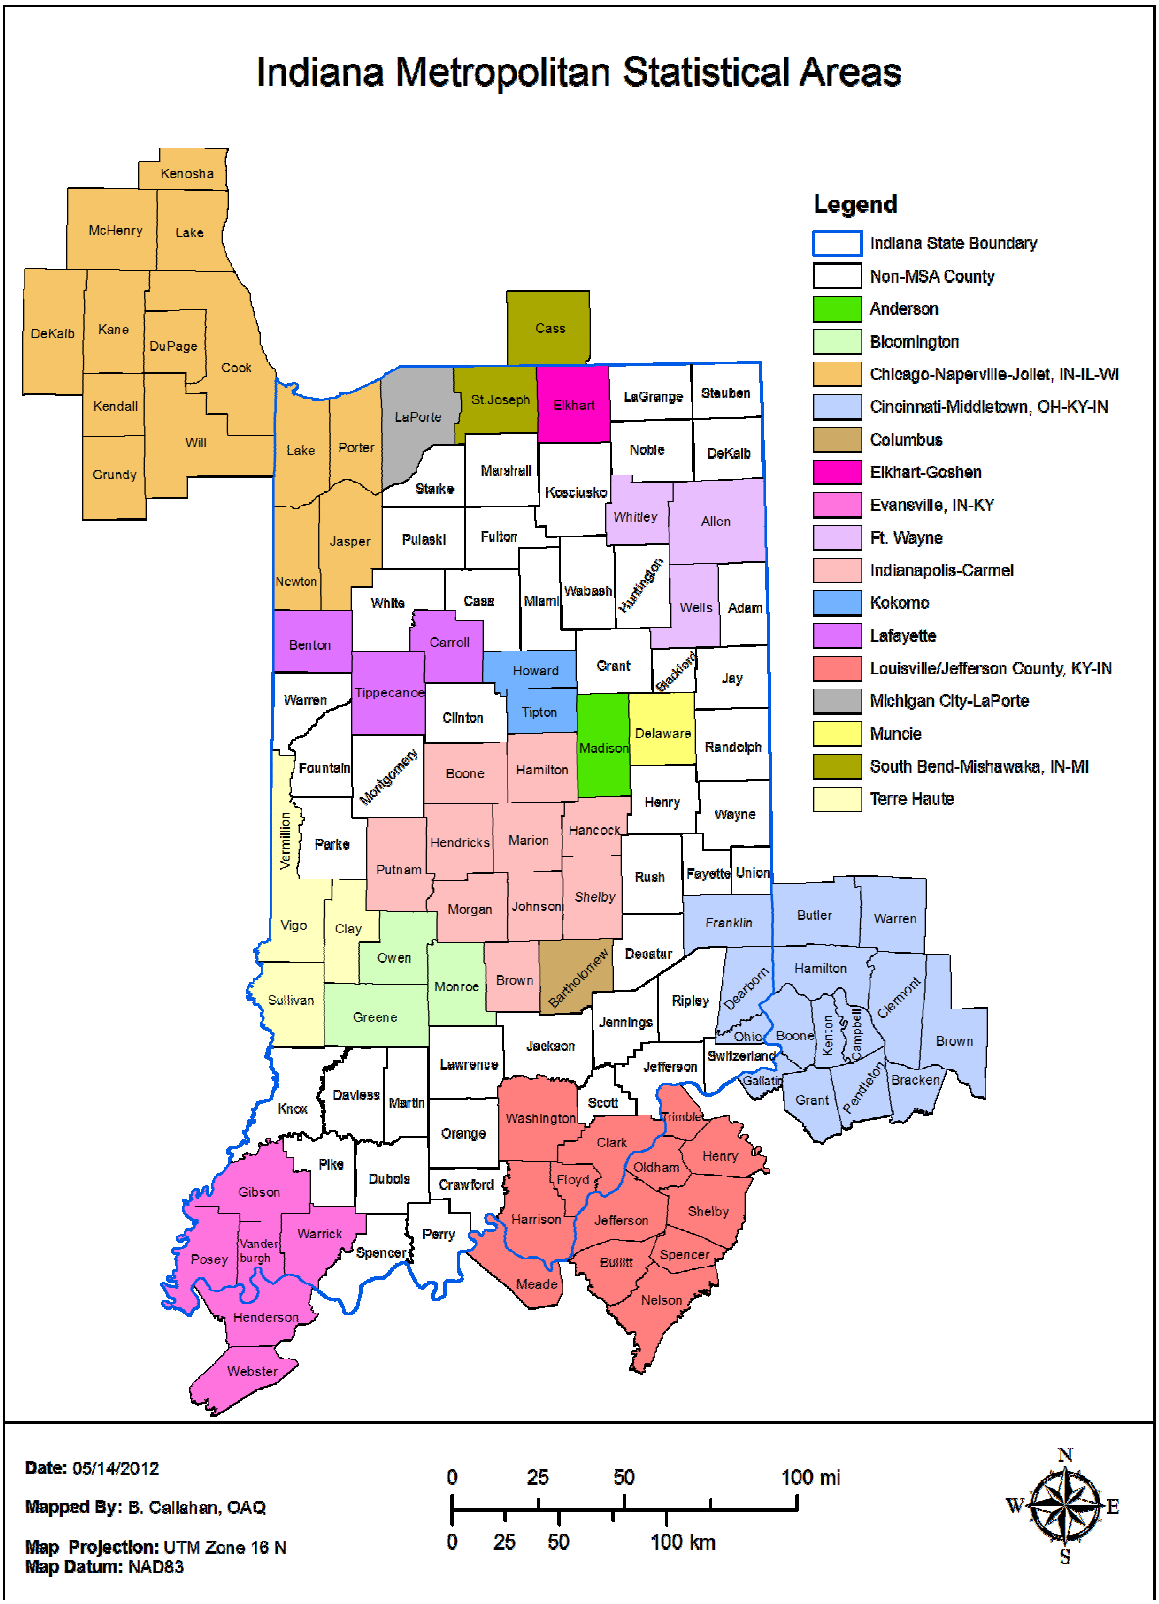
O_3, PM_{10}, and $PM_{2.5}$ have minimum monitoring requirements based upon the population of an MSA. Population data from the 2010 census is used in this report.

According to 2.(e) of this appendix, "The EPA recognizes that State and local agencies must consider MSA/CSA boundaries and their own political boundaries and geographical characteristics in designing their air monitoring networks. The EPA recognizes that there may be situations where the EPA Regional Administrator and the affected State or local agencies may need to augment or to divide the overall MSA/CSA monitoring responsibilities and requirements among these various agencies to achieve an effective network design. Full monitoring requirements apply separately to each affected State or local

agency in the absence of an agreement between the affected agencies and the EPA Regional Administrator." The individual tables list the data, the requirements, and the current sites for the full multi agency MSAs. In the instances where it is more logical or desirable to divide the monitoring requirements, Indiana has entered into agreements with some of the neighboring agencies to ensure that the minimum requirements for the MSA continue to be met and the resulting network provides adequate coverage. Agreements have been signed with the Southwest Ohio Air Quality Agency (SWOAQA) and the Louisville Metropolitan Air Pollution Control District (APCD).

The placement of a monitoring probe, its spacing from obstructions, and probe materials are outlined in Appendix E of 40 CFR Part 58, which deals with the placement of the monitoring probe, it's spacing from obstructions and what materials the probe can be made of. All monitors operated in Indiana meet Appendix E criteria.

Figure 2 – Indiana MSAs



Parameter Networks

Carbon Monoxide (CO)

Monitoring Requirements

40 CFR Part 58 Appendix D, 4.2 details the requirements for CO monitoring. One CO monitor is required to operate collocated with one required near-road NO2 monitor in CBSAs having a population of 1,000,000 or more persons. Other CO monitors may be required if deemed necessary by the Regional Administrator. As per 58.13(2) Indiana's CO site should be operational by January 1, 2017.

In addition 40 CFR Part 58 Appendix D, 3(b) states that CO measurements will be included at the NCore multi-pollutant monitoring sites. CO is monitored at Indpls-Washington Park NCore site.

Microscale and middle scale measurements are useful classifications for SLAMS CO sites since most people have the potential for exposure on these scales. Maximum CO concentrations primarily occur in areas near major roadways and intersections with high traffic density and often poor atmospheric ventilation.

Middle scale CO monitoring is intended to represent areas with dimensions from 100 meters to 0.5 kilometers. In some cases middle scale measurements may apply to areas that have a total length of several kilometers such as "Line Emission Sources." This type of emission source area would include air quality along a commercially developed street, shopping plaza, freeway corridor, parking lots and feeder streets.

Microscale CO monitoring applies when air quality measurements are to be used to represent distributions within street canyons, over sidewalks, and near major roadways. Microscale measurements in one location can often be considered as representative of similar locations throughout a city.

Monitoring Methodology

Indiana's CO monitoring network collects data with the Thermo Environmental Model 48c and Model 48i analyzers using nondispersive infrared monitoring methodology. The API Model 300EU Trace level/Ultra-sensitive analyzer is used to collect trace level CO data at the NCore Indpls - Washington Park site.

Monitoring Network

Indiana operates six CO monitors located throughout the state, as displayed in Figure 3. The details of the current network, along with any changes planned in 2013, are listed in Table 2.

Network Modifications

There are no changes planned for the CO monitoring network in 2013. Indiana plans to install a CO monitor at the near-road NO_2 site when it becomes operational on January 1, 2014.

Lead (Pb)

Monitoring Requirements

40 CFR Part 58 Appendix D, 4.5 specifies that Pb monitoring must be conducted taking into account Pb sources which are expected to or have been shown to contribute to a maximum Pb concentration in ambient air in excess of the NAAQS, the potential for population exposure, and logistics. At a minimum there must be one (1) source-oriented SLAMS site located to measure the maximum Pb concentration in ambient air resulting from each Pb source which emits 0.5 or more tons per year. Waivers may be granted if the state can demonstrate the Pb source will not contribute to a maximum Pb concentration in ambient air in excess of 50% of the NAAQS.

In addition, Pb monitoring is required at any NCore site in each CBSA with a population equal to or greater than 500,000 people. This site is located at Indpls – Washington Park (180970078) and has been collecting data since 1999.

Collocated samplers are required at 15% of the sites operated by a PQAO or a minimum of one per network. Indiana is required to operate one collocated site.

Monitoring Scale

The appropriate scales for the source-oriented sites are either microscale (up to 100 meters) or middle scale (100 to 500 meters). The neighborhood scale (0.5 – 4.0 kilometers) is the appropriate scale for population-oriented monitoring.

Monitoring Methodology

Indiana utilizes TSP filter sampling with atomic absorption analysis to generate ambient Pb concentrations from the monitoring sites.

Monitoring Network

The Pb monitoring network in Indiana in 2012 consists of eight sites. These sites are displayed in Figure 4, and detailed in Table 3. The East Chicago – Marina (180890034) is in the process of being established. Electrical power and security in the form of fencing need to be installed. The new site should be operational by August 2012.

Network Modifications

Due to the elevated concentrations measured at Muncie – Mt. Pleasant Blvd. (180350009) additional sampling will be performed, but the sampling frequency will remain at 1/6 day.

There are no changes planned for the Pb monitoring network in 2013.

MONITORING METHOD: 803 - HI-VOL SAMPLER/ATOMIC ABSORPTION ANALYSIS

Oxides of Nitrogen (NO, NO_2, NO_x, NO_y)

Monitoring Requirements

On February 9, 2010, the Federal Register amended 40 CFR Parts 50 and 58 establishing a new NO_2 NAAQS for one (1) hour concentrations, and new monitoring requirements to be implemented by January 1, 2013.

One microscale near-road NO_2 monitoring station must be located within each CBSA with a population of 500,000 or more to be installed by January 1, 2013. An additional near-road NO_2 monitoring station is required for any CBSA with a population of 2,500,000 persons or more. For Indiana, one near-road site is required for Indianapolis-Carmel MSA. Additionally, sites are required for the Cincinnati-Middletown, OH-KY-IN CBSA, the Louisville/Jefferson County, KY-IN CBSA, and the Chicago-Naperville-Joliet, IN-IL-WI CBSA. These cross state requirements are addressed in agreements signed with the appropriate neighboring agencies.

One area-wide NO_2 monitoring station must also be located in each CBSA with a population greater than 1,000,000 persons to be installed by January 1, 2013. Each area listed above also requires an area-wide monitor.

40 CFR Part 58 Appendix D 3(b) and 40 CFR Part 58 Appendix D, 4.3 state that NO/NO_y measurements should be included at the NCore multi-pollutant monitoring sites and the PAMS program. NO/NO_y monitors are used at these sites because it is important to collect data on total reactive nitrogen species for understanding O_3 photochemistry.

Monitoring Methodology

The NO, NO_2 and NO_x network uses the Thermo Environmental Model 42c and the 42i chemiluminescence monitors to collect data. The API Model 200EU/501 NO_y Trace level/Ultra-sensitive analyzer is used to collect NO and NO_y data at the Indpls - Washington Park NCore site (180970078).

Monitoring Network

Indiana operates four NO_2 monitors and one trace level monitor as displayed in Figure 5. The current network, along with any changes planned in 2013, is listed in Table 4.

Network Modifications

The original date for the near-road NO_2 site installation was January 1, 2013. Due to delays in funding and implementation of the pilot sites, the site in Indianapolis is scheduled to be operational on January 1, 2014. The area-wide NO_2 monitor will be installed at Indpls – Washington Park (180970078) by January 1, 2014. Details of the new NO_2 monitoring sites are being submitted in a separate NO_2 Monitoring Plan to USEPA.

In order to obtain true background NO_2 concentrations to be used by IDEM for PSD modeling, urban scaled NO_2 monitors will be installed at Larwill (181830003), and at a new Columbus site beginning in January 2013. These monitors will collect data for three years.

Ozone (O_3)

Monitoring Requirements

Table D-2 in 40CFR Part 58 Appendix D details the number of O_3 sites required in each MSA. The number of sites is based on the population of an MSA and if the design value exceeds 85% of the standard (0.064 ppm) for that area. Table 5 lists the requirements stated in Part 58. Table 6 lists the requirements as they relate to Indiana. There are five MSAs which cross state lines. Except for Cincinnati, Indiana meets the requirement for the full MSA, in the multi-agency MSAs. A multi-agency agreement between the Southwest Ohio Air Quality Agency (Cincinnati, OH) and IDEM specifies that Southwest Ohio Air Quality Agency will fulfill all the O_3 monitoring requirements in this MSA. In the absence of an agreement, Indiana would be required to operate two sites in the Cincinnati MSA and 21 additional monitoring sites overall.

Monitoring Season

Table D-3 of Appendix D of Part 58 defines the O_3 monitoring season for all of the states. Indiana's monitoring season is from April 1 to September 30. Indiana operates one site in Illinois (West Union) and two sites (Charlestown State Park and New Albany) in the Louisville MSA. As the monitoring season extends through October in Illinois and Kentucky, Indiana operates these three sites through October as well. In addition, the Charlestown State Park and New Albany sites in the Louisville MSA will be operated in March to correspond with Kentucky's ozone season.

It is anticipated that new monitoring requirements may be promulgated in July 2012. If any changes in the monitoring season are required to begin in 2013, Indiana will implement any season modification at that time.

Data

The design value for an area, usually a county or an MSA, is determined by the three year average of the 4^{th} highest daily 8-hour maximum from the highest site in the area. If this value is greater than 0.075 ppm then the area is considered to be in nonattainment of the NAAQS. If the air quality improves and the design value is 0.075 ppm or less, then the area may be reclassified as a maintenance area. The design values for all sites for the most recent sampling period (2009 – 2011) along with the 1997 8-hr attainment areas with maintenance plans (based on current NAAQS of 0.075 ppm) are illustrated in Figure 6. All O_3 monitoring sites are under the 0.075 ppm for the most recent sampling period of 2009 through 2011.

Monitoring Methodology

All monitoring sites in Indiana use O_3 analyzers from Thermo Electron, Models 49c, or 49i. These monitors use ultraviolet absorption photometry. Air is drawn through a sample cell where ultraviolet light (254 nm wavelength) passes through. Any light that is not absorbed by the ozone is then converted into an electrical signal proportional to the ozone concentration.

Monitoring Network

Currently there are 42 monitoring sites in Indiana's O_3 monitoring network as displayed in Figure 7. The O_3 monitoring network with any changes proposed for 2013 is in Table 7.

Network Modifications

The Boonville site (181730008) will be discontinued. The data being collected at Boonville is very similar to the data being collected at Lynnville (181730009) and Evansville-Buena Vista (181630021). The

Correlation Factors between Boonville and Lynnville, and Boonville and Evansville - Buena Vista for the years 2009 – 2011 are both 0.92.

A new O_3 site will be installed downwind of the City of Columbus to provide concentrations in the Columbus MSA.

Table 5 – SLAMS Minimum O_3 Monitoring Requirement

O3 MONITORING METHOD: 047 - THERMO ELECTRON 49C, 49i

Particulate Matter (PM_{10})

Monitoring Requirements

The requirements for the design of the PM_{10} monitoring network are listed in 40 CFR Part 58 Appendix D 4.6. Indiana must operate the minimum number of sites as defined by the MSA population and the past design value of the area. Table 8 lists the sites required per MSA along with the design value in the proper category for each MSA. The current and proposed networks are also listed. There are five MSAs which cross state lines. Indiana meets the requirement for the number of sites for the full MSA, in the multi-agency MSAs, except for Cincinnati and Louisville. IDEM has multi-agency agreements with Southwest Ohio Air Quality Agency (Cincinnati, OH) and Louisville Metropolitan Air Pollution Control District (APCD) specifying the sites which will operate in each district to fulfill the PM_{10} monitoring requirements in the Cincinnati and Louisville MSAs

Collocated samplers are required at 15% of the sites in the network to determine monitoring precision. IDEM is required to operate three collocated samplers.

Monitoring Methodology

Intermittent PM_{10} samples are collected on a pre-weighed 46.2 mm Teflon filter. Air is drawn through an inlet designed to pass only particles smaller than 10 microns in diameter and across the filter for 24 hours. It is then removed and weighed again. Concentrations are calculated by dividing the weight gain by the volume of air passed through the filter.

Continuous PM_{10} concentrations are obtained by using an R&P TEOM 1400a which collects the particulate on a filter attached to an oscillating glass rod. The concentration of the particulate is proportional to the change in oscillating frequency.

Monitoring Network

Indiana currently operates 15 monitoring sites in the State. The 2013 network is displayed in Figure 10. Concentrations at all sites except for two source-oriented sites in Northwest Indiana, Gary – IITRI (180890022) and Portage – Hwy 12 (181270023), are well under 50% of the daily NAAQS of 150ug/m^3. Table 11 details the current PM_{10} network and the modifications planned for 2013.

Network Modifications

There are two network modifications planned for 2013. Monitoring at Hammond – Clark H.S. (180892010) will be discontinued due to consistently having the lowest annual average in Lake County over the last 10 years. Table 9 and Figure 8 display the annual average data from 2002 through 2011.

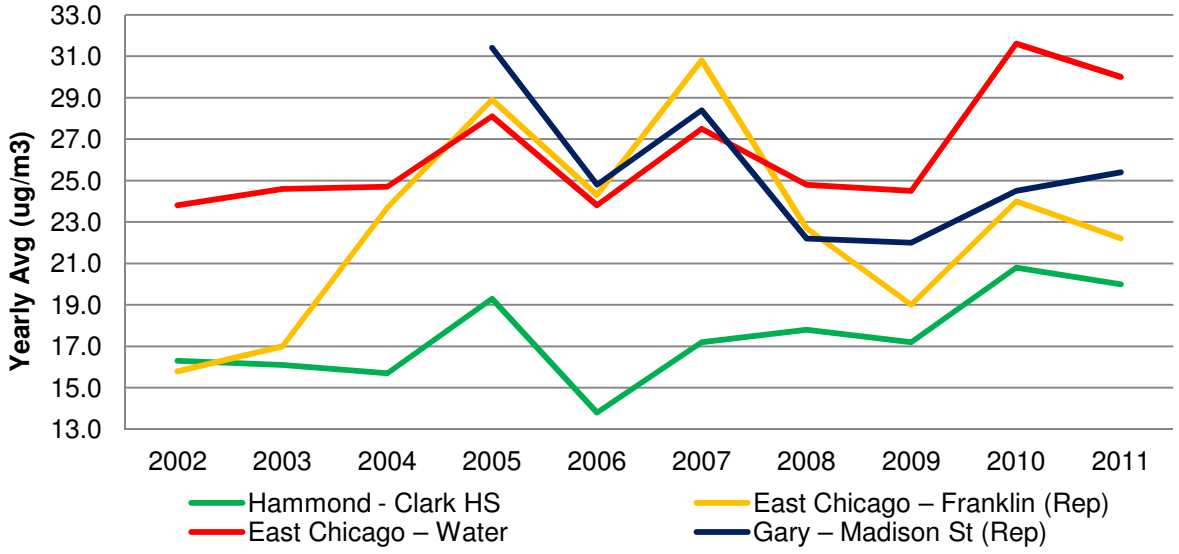
Figure 8 – Lake County PM_{10} Sites



The second modification planned for 2013 is to discontinue Indpls - Drover St. (180970071) and to move the collocated sampler to Indpls - West Street (180970043). The Indpls - Drover St. sampler has lower annual averages and tracks with the Indpls - West St. sampler, but at a lower concentration. Since the samplers are located only ½ miles apart, the data show that both samplers are measuring the same area sources emissions. Table 10 and Figure 9 display the annual average data from 2002 through 2011.

The network will still maintain three collocated samplers to fulfill the monitoring requirements.

PM10 MONITORING METHODS: 079 - R & P TEOM 1400, 1400 A
127 - R&P 2025A Sequential

Fine Particulate Matter ($PM_{2.5}$)

Monitoring Requirements

40CFR Part 58, Appendix D 4.7 details the number of $PM_{2.5}$ sites required in each MSA. The number of sites is based on the population of an MSA and if the design value for that area is greater or less than 85% of either NAAQS. Table 11 (Table D-5 of Appendix D) lists the minimum requirements as stated in Part 58. Table 12 lists the requirements as they relate to Indiana. Indiana meets the minimum number of sites for each MSA within Indiana's boundaries. There are five MSAs which cross state lines. Except for Cincinnati, Indiana meets the requirement for the number of sites for the full MSA, in the multi-agency MSAs. An agreement between the SWOAQA and IDEM specifies that SWOAQA will fulfill the $PM_{2.5}$ monitoring requirements in this MSA. In the absence of an agreement, Indiana would be required to operate three sites in the Cincinnati MSA, and 17 additional monitoring sites overall.

In addition, 40 CFR, Appendix D, 4.7.2 states that "State, or where appropriate, local agencies must operate continuous fine particulate analyzers equal to at least one-half (round up) the minimum required sites listed in Table D-5 (Table 11) of this appendix. At least one required FRM/FEM monitor in each MSA must be collocated." As these requirements are applied to Indiana, 11 would be required. Indiana meets this requirement in all MSAs, except Cincinnati and Louisville. IDEM has multi-agency agreements with SWOAQA (Cincinnati, OH) and Louisville Metropolitan Air Pollution Control District (APCD) specifying the sites which will operate in each district to fulfill the $PM_{2.5}$ monitoring requirements in the Cincinnati and Louisville MSAs.

Collocated samplers are required at 15% of the FRM/FEM sites operated by each PQAO. IDEM is the sole PQAO for Indiana and plans to operate 34 sites. Indiana is required to have five collocated samplers.

Table 12 – SLAMS Minimum $PM_{2.5}$ Monitoring Site Requirements

Number of Sites per MSA and Design Value		
MSA Population	3 yr DV ≥ 85% of either NAAQS	3 yr DV < 85% of either NAAQS
> 1,000,000	3	2
500,000 - 1,000,000	2	1
50,000 - 500,000	1	0
	also	
	Statewide Background Site	1
	Statewide Transport Site	1
85% of Daily NAAQS = 29.75ug/m^3		
85% of Annual NAAQS = 12.75ug/m^3		

Monitoring Methodology

Intermittent $PM_{2.5}$ is sampled by drawing air through a specially designed inlet that excludes particles larger than 2.5 microns in diameter. The remaining particles are collected on a Teflon™ Microfiber filter that is weighed before and after the sampling period to determine the particulate mass. Indiana uses the R&P 2025 Sequential Samplers (FEM) (EQPM-0202-145) to collect intermittent data. The normal sampling schedule varies, as determined by the regulations: four sites sample every day, the remainder sample every 3rd day. Collocated monitors used for assessing data precision operate on a one in six day schedule.

Continuous data are collected using one of the following monitors: Met One BAM 1020 $PM_{2.5}$ (FEM) (EQPM-0308-170), Thermo Scientific TEOM 1400a with Series 8500C FDMS (EQPM-0609-181), or Thermo Scientific Model 5030 SHARP (EQPM-0609-184). The BAM 1020 collects fine particulate through a sampling inlet onto a filter tape, using a beta ray transmission to measure the amount of particulate concentration collected during a specific sampling period. The TEOM 1400a collects the particulate on a filter attached to an oscillating microbalance. The concentration of the particulate is proportional to the change in the oscillating frequency. The SHARP 5030 collects the particulate onto a filter tape and uses a beta ray transmission to measure the amount of particulate concentration, similar to the BAM 1020 FEM. In addition, it also has an optical assembly that senses the light scattered by the aerosol and is constantly referenced to the measurement of the mass sensor.

			Sites in Indiana Network		35	34	18	18

Monitoring Network

In 2012 the Indiana $PM_{2.5}$ monitoring network consists of 35 monitoring sites. The number of monitoring sites includes the operational sites at the beginning of the year, and the southeast Hamilton County (Fishers area) site, Columbus site, Kokomo site, and a replacement site for Evansville Post Office. The Fishers area site had been proposed to be operational in 2010. Locations had to be changed, and the agreements necessary to install this site are still being negotiated. It is anticipated that this site will be established prior to the end of 2012. The Columbus, Kokomo, and replacement site for Evansville Post Office are anticipated to be established prior to the end of 2012.

Continuous monitors will be collecting data at 18 of the site locations in 2013.

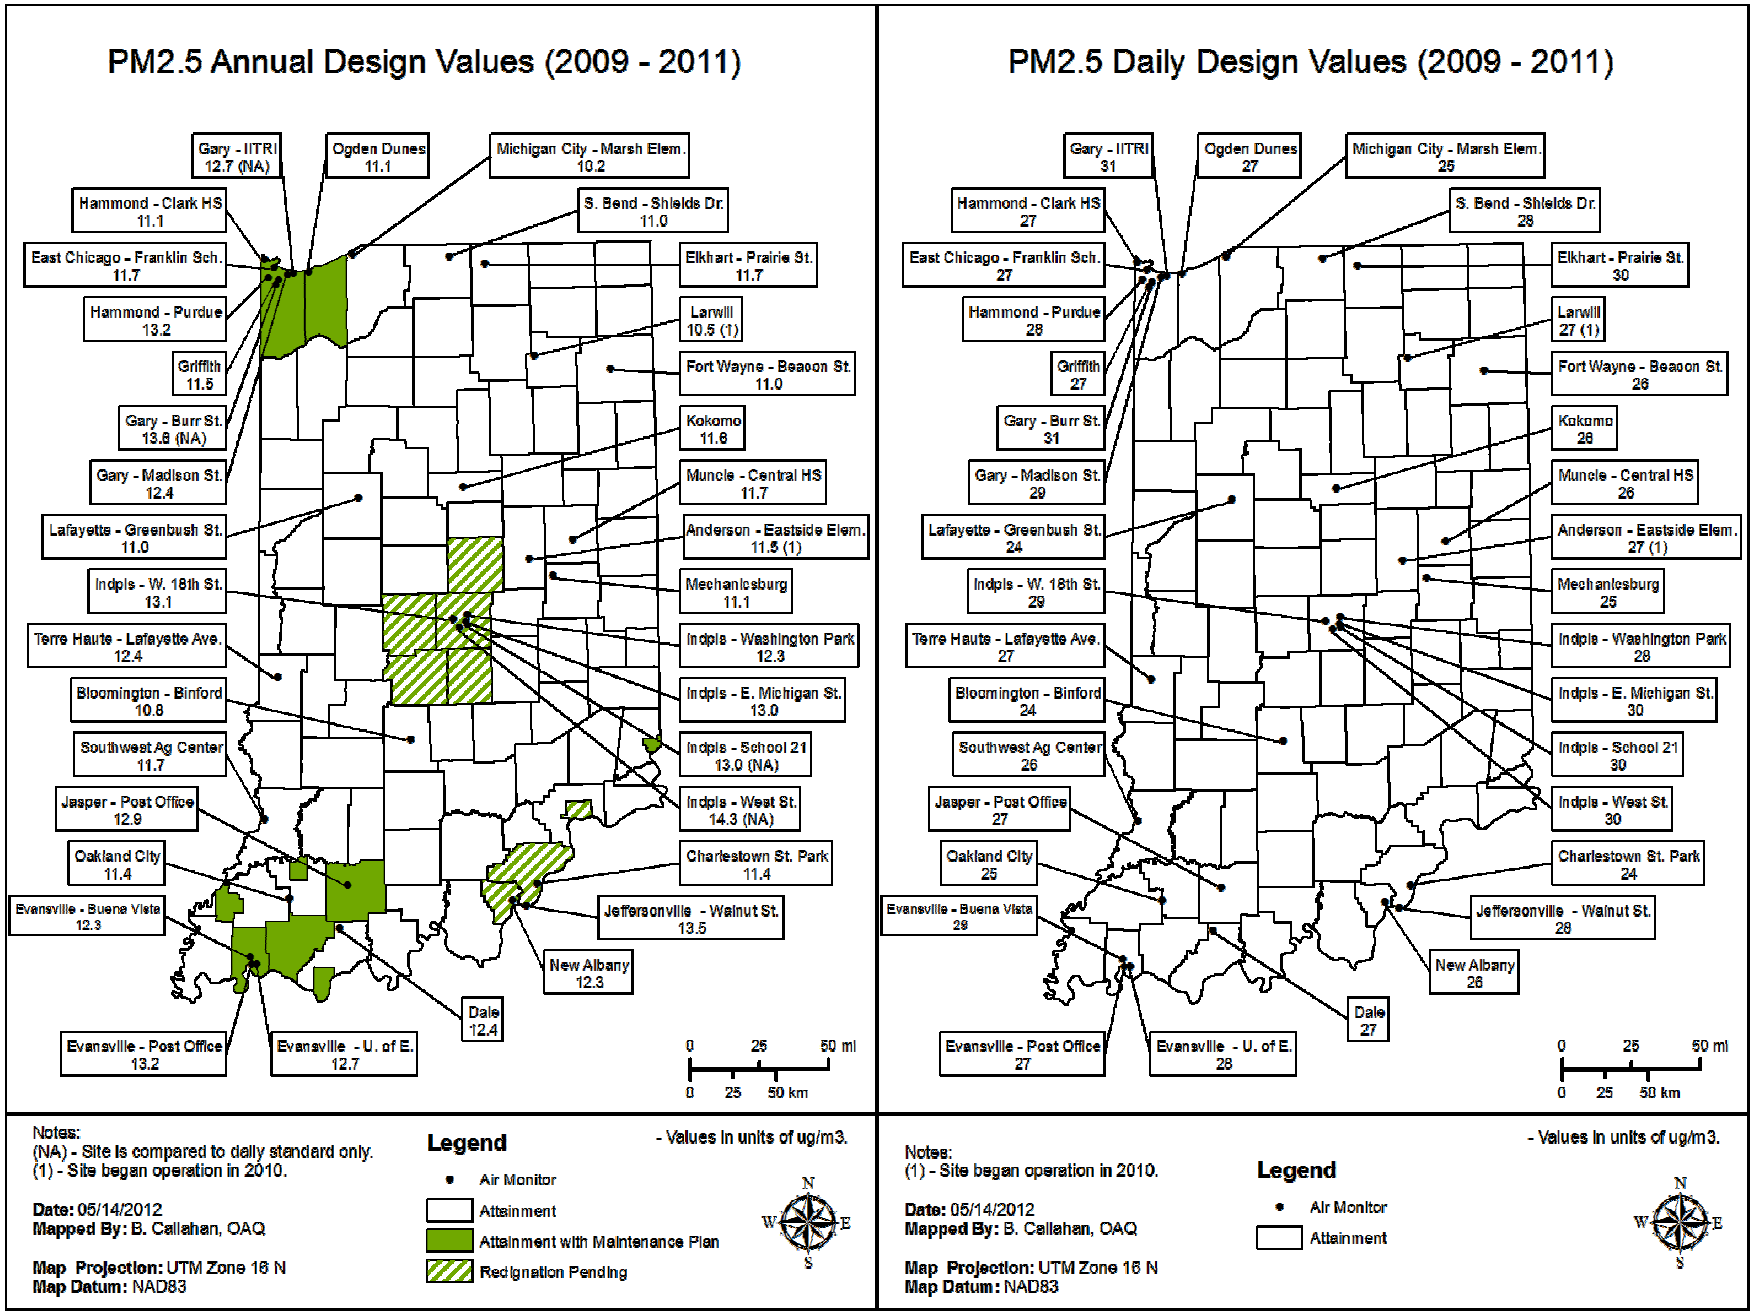
Data / Design Value

Only the intermittent data collected from the FEM samplers are eligible for comparison to the NAAQS and used for calculation of the design value for a site. The continuous data are used for AQI calculations and AIRNow mapping. The continuous data will continue to be compared to the intermittent data to determine when it would be appropriate to use it for NAAQS comparison purposes.

A site's annual design value is calculated by averaging the weighted annual averages from a site over a three year period. The highest site design value in an MSA is generally determined to be the design value for the area. It is compared to the NAAQS to determine attainment/nonattainment for the area. Similarly, a site's daily design value is obtained by averaging the 98th percentile values from a 3 year period. This value is then compared to the daily NAAQS, 35 ug/m^3, to determine attainment/nonattainment of the daily standard.

The design values for all sites for the most recent sampling period (2009 - 2011) along with the designation status of areas for $PM_{2.5}$ are on the maps in Figure 11. Currently all counties in Indiana meet the NAAQS for $PM_{2.5}$.

Figure 11 – $PM_{2.5}$ Site Design Values



Network Modifications

The $PM_{2.5}$ monitoring network with the changes proposed for 2013 is in Table 16. A map of the 2013 network is in Figure 13.

Additional collocated monitors will be added to the network to run alongside the continuous $PM_{2.5}$ instruments. A Met One BAM will be collocated with the Met One BAM at Terre Haute – Lafayette Ave. (181670018). R&P 2025 Sequential Samplers will be collocated with the continuous methods at Ft. Wayne - Beacon St. (18003004) and at Ogden Dunes (181270024).The intermittent samplers will operate on a 1/3 sampling frequency.

The Hammond – Clark H.S. (180892010) site will be discontinued at the end of 2012. Summaries of the data and design values from Hammond – Clark H.S. (180892010), Hammond – Purdue (180892004), East Chicago – Franklin (180890006), and Gary – Madison St. (180890031) are in Tables 14 & 15, and Figure 12. Hammond – Clark H.S.'s annual averages and design values are the lowest in Lake County and are more closely related to the suburban site of Ogden Dunes (181270024).

Table 14 – Lake County $PM_{2.5}$ Annual Average Data

$PM_{2.5}$ Data										
	Hammond – Purdue		Hammond - Clark HS		East Chicago – Franklin		Gary – Madison St		Ogden Dunes	
Year	Annual Average	Annual Design Value	Annual Average	Annual Design Value	Annual Average	Annual Design Value	Annual Average	Annual Design Value	Annual Average	Annual Design Value
2005	15.4		15.6		15.8		***16.8***		14.6	
2006	12.7		12.7		13.2		13.3		11.8

2009		***13.8***	10.8	12.3	11.3	12.6	12.1	12.9	11.3	12.0
2010	12.3	13.3	11.9	11.7	12.5	11.9	12.9	12.4	11.6	11.2
2011	11.4	13.2	10.7	11.1	11.4	11.7	12.1	12.4	10.6	11.1

Values in **Bold**/**Italics** did not meet completeness criteria
There was insufficient data to calculate the 2009 annual average for Hammond Purdue

Figure 12 – Lake County $PM_{2.5}$ Annual Average

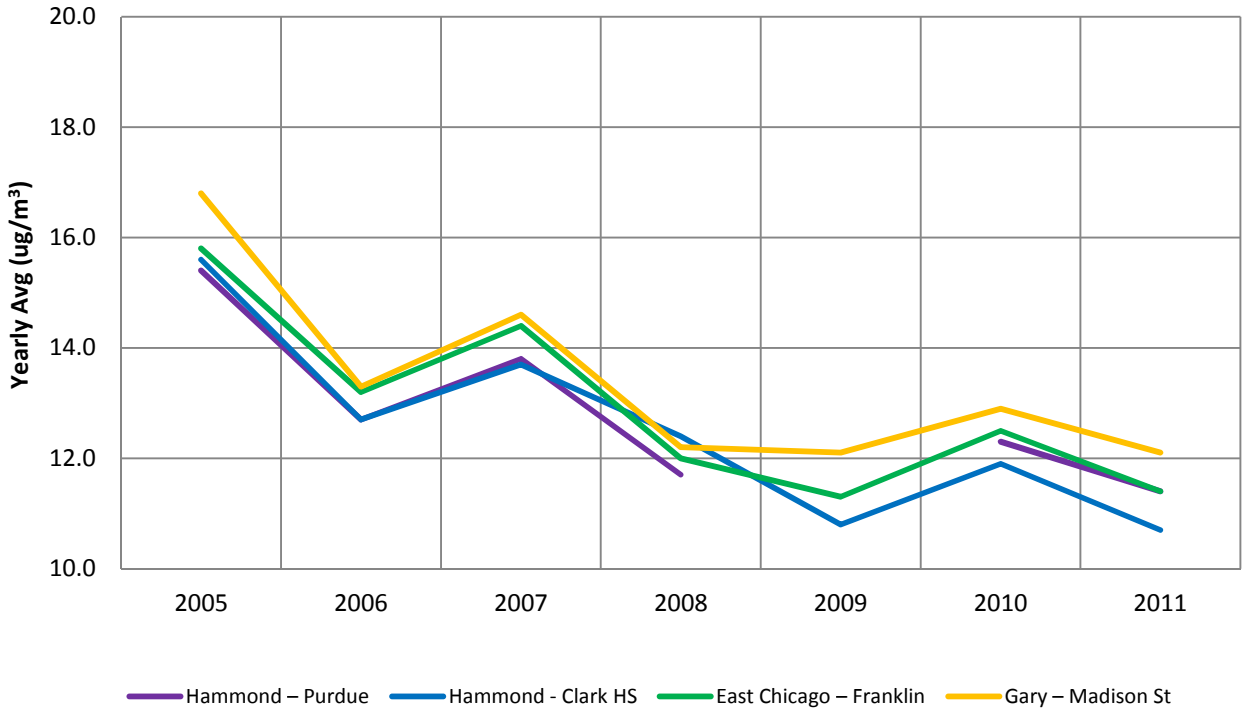

Table 15 – Lake County $PM_{2.5}$ Daily Design Values

Daily Design Values						
Year	**Hammond – Purdue**	**Hammond - Clark HS**	**East Chicago – Franklin**	**Gary – Madison St**	**Gary – IITRI**	**Ogden Dunes**
05-07	33	35	***36***	34	***35***	32
06-08	30	***30***	***31***	31	31	33
07-09	32	***30***	30	32	31	30
08-10	***30***	***28***	27	31	31	28
09-11	***28***	27	27	29	***31***	27

As per 40CFR Part 58.12, if the daily design value of an area is within plus or minus 5% of the NAAQS, then sampling must be daily. Each year the data are evaluated to determine which sites must collect daily data. The design values from the period of 2009 through 2011 will determine which sites will collect daily samples in 2013. No sites are required to collect daily samples. However, Indpls – Washington Park (180970078) and Indpls – W. 18th St. (180970081) will continue sampling daily to continue to collect comparison data for the continuous monitors operating at these sites. Jeffersonville – Walnut St. (180190006) will also collect daily samples to continue to collect more data for the Jeffersonville Special Study.

Unanticipated Network Changes

Since Indiana has not opted to spatially average $PM_{2.5}$ values from multiple sites in an MSA, if access to a site is lost or the site must be discontinued, and that site is violating the NAAQS for $PM_{2.5}$, a new site need not be found, if the 'design value site' for the MSA is still operational. The attainment of the area would still be determined by the 'design value site'. However, if the violating 'design value site' were to be lost, every effort would be made to obtain a new site close to the old site and having the same scale of representativeness and monitoring objectives as the original site.

** According to 40 CFR Part 58 Subpart D, PM2.5 data that is representative of a unique population-oriented scale or localized hot spot are only eligible for comparison to the 24-hour PM2.5 NAAQS. The annual standard does not apply.

MONITORING METHODS: *145 - R & P 2025* *170 - MET ONE BAM - FEM*
184 - Thermo SHARP *181 - FDMS TEOM*

Sulfur Dioxide (SO_2)

Monitoring Requirements

40 CFR Part 58 Appendix D, 4.4 details the requirements for SO_2 monitoring. U.S.EPA had revised the primary NAAQS in 2010. The new standard is based on the 3-year average of the 99th percentile of the yearly distribution of 1-hour daily maximum SO_2 concentrations. The level of the new 1-hour standard is 75 ppb. The monitoring requirements have also been revised. U.S.EPA is setting specific minimum requirements as to location and number of SO_2 monitors. Monitoring is required in CBSAs based on a population weighted emissions index (PWEI) for the area.

The appropriate spatial scales for SO_2 SLAMS monitoring are the microscale, middle, neighborhood, and urban scales. Monitors sited at the microscale, middle, and neighborhood scales are suitable for determining maximum hourly concentrations. Monitors sited at urban scales are useful for identifying SO_2 transport, trends, and background concentrations if sited upwind of a source.

40 CFR Part 58.10 (a)(3) requires NCore monitoring. 40 CFR Part 58 Appendix D, 3(b) states that SO_2 measurements will be included at the NCore multi-pollutant monitoring sites. Multi-point NCore monitoring sites provide data for metropolitan area trends analyses, a general control strategy, and progress tracking.

Monitoring Methodology

Indiana's SO_2 monitoring network collects data with Thermo Environmental Models 43c, 43i and the API Model 100E using pulsed ultra-violet fluorescence monitoring methodology. The API Model 100EU Trace level/Ultra-sensitive analyzer is used to collect trace level SO_2 data at the NCore, Indpls - Washington Park site.

Monitoring Network

Indiana operates eight SO_2 monitors located throughout the state, as displayed in Figure 14. The current network, along with any changes planned in 2013, is listed in Table 17.

Network Modifications

Network modifications are set to occur in 2013. In order to obtain true background SO_2 concentrations to be used by IDEM for PSD modeling, urban scaled SO_2 monitors will be installed at Larwill (181830003), and at a new Columbus site beginning in January 2013 to collect data for three years.

$PM_{2.5}$ Speciation

Monitoring Requirements

Monitoring requirements in 40 CFR Part 58 Appendix D 4.7.4 states that “each state shall continue to conduct chemical speciation monitoring and analyses at sites designated to be part of the $PM_{2.5}$ Speciation Trends Network (STN).”

Monitoring Methodology

Intermittent speciation samples are collected on three different filter mediums, each for a specific analysis and list of compounds. A Teflon filter using the Energy Dispersive X-ray Fluorescence analysis methodology is used to target the mass and thirty-three (33) trace metals. A nylon filter using Ion Chromatography for an analytical method is used to target sulfates, nitrates, and three (3) cations; ammonium, potassium, and sodium. And a quartz fiber filter using Thermal Optical Analysis is used to target organic, elemental, and total carbon.

The Met One SASS is used to collect Mass-$PM_{2.5}$, trace elements, Cations-$PM_{2.5}$, Nitrate-$PM_{2.5}$, and Sulfate-$PM_{2.5}$ data. The URG-3000N sampler is used to collect organic and elemental carbon data. Samples are collected on a 1/6 day sampling frequency at all sites except Indpls - Washington Park (180970078), which samples every third day.

Indiana also operates continuous speciation monitors at four (4) different locations. A Magee Aethalometer, using optical absorption analysis methodology, is used for sampling black carbon at Indpls - Washington Park, Gary - IITRI (180890022), Evansville - Buena Vista (181630021), and Elkhart - Prairie St.(180390008). A Thermo Electron Sulfate Particulate Analyzer, using Catalytic Thermal Reduction and Pulsed Fluorescence analysis, monitors sulfates at Indpls - Washington Park and Evansville - Buena Vista.

Monitoring Network

The Indiana speciation network consists of seven sites across the state. The current network, along with any changes planned for 2013, is listed in Table 18, and displayed in Figure 15.

Network Modifications

A carbon screening study is planned to be conducted in 2013 at four locations in Indiana. A small portable Aethalometer will be used for this study. Black carbon (elemental component) and possibly UV carbon (organic component) will be collected by the Aethalometer. Each site will collect data once every 3 days, as per the 2013 EPA Alternate Speciation Monitoring Schedule. The data is collected continuously for a 24-hour period, showing episodes down to 5 minutes. The data will be evaluated to determine if more monitoring is needed for that specific area of the State, whether it is a continuous $PM_{2.5}$ sampler and/or a stationary Aethalometer. Human activities produce black carbon, which can harm public health. The data collected will help contribute to making effective policy decisions. The four sites slated for this special study include; 1) Clarksville (180190009), an existing site currently collecting toxic data; 2) A new site located in Northeast, IN near the I-69 and Toll Road interchange; 3) A new site in Lawrenceburg, IN, an upwind site for the Cincinnati area; and 4) A new site located in Northwest, IN near the Toll Road across from the Illinois State line and located near the Amtrak Station.

PAMS Ozone Precursors (VOCs)

Monitoring Requirements

Ozone precursor monitoring is required as part of the PAMS program. The specific requirements are addressed in Table D-6 of 40 CFR Part 58 Appendix D. According to the Modified Network Plan for the Chicago Nonattainment Area, Indiana operates one (1) type 2 PAMS site. A type 2 site requires measurements for speciated VOCs, carbonyls, NO_x, CO, O_3, and surface met.

This section deals with the speciated VOCs. The other parameters are addressed in their own area. According to the plan, 56 speciated VOCs are to be collected at Indiana's PAMS site.

Monitoring Methodology

Ozone precursor VOCs are collected continuously using a Perkin Elmer Clarus 500 Gas Chromatograph (GC), with dual Flame Ionization Detectors (FIDs) and a TurboMatrix thermal desorber. In addition, canister samples are collected on a 1/6 day sampling schedule. These canisters are analyzed using the same analytical method. These are the 56 PAMS target compounds:

Ethylene	Acetylene	Ethane	Propylene
Propane	Isobutane	1-Butene	n-Butane
t-2-Butene	c-2-Butene	*Isopentane*	1-Pentene
n-Pentane	Isoprene	t-2-Pentene	c-2-Pentene
2,2-Dimethylbutane	Cyclopentane	2,3-Dimethylbutane	2-Methylpentane
3-Methylpentane	n-Hexane	Methylcyclopentane	2,4-Dimethylpentane
Benzene	Cyclohexane	2-Methylhexane	2,3-Dimethylpentane
3-Methylhexane	2,2,4-Trimethylpentane	n-Heptane	Methylcyclohexane
2,3,4-Trimethylpentane	Toluene	2-Methylheptane	3-Methylheptane
n-Octane	Ethylbenzene	m-Xylene	p-Xylene
Styrene	o-Xylene	n-Nonane	Isopropylbenzene
n-Propylbenzene	m-Ethyltoluene	p-Ethyltoluene	1,3,5-Trimethylbenzene
o-Ethyltoluene	1,2,4-Trimethylbenzene	n-Decane	1,2,3-Trimethylbenzene
m-Diethylbenzene	p-Diethylbenzene	n-Undecane	Dodecane

In addition to these individual compounds, there are two aggregated parameters reported; sum of PAMS compounds and total NMOC.

Monitoring Network

Indiana operates one PAMS monitoring sites collecting ozone precursors VOCs at Gary - IITRI (180890022) for the Chicago PAMS area, and one PAMS-like site at Indpls - Washington Park (180970078) to collect data for the Indianapolis MSA. The normal PAMS monitoring season is June, July, and August, but Indiana began collecting data year-round in 2011 to observe values outside the season as well. The site details are in Table 19.

Network Modifications

No changes are planned for ozone precursor VOC monitoring in 2013.

Toxics (VOCs)

Monitoring Requirements

There are no requirements for toxics monitoring listed in 40 CFR Part 58.

Monitoring Methodology

Indiana uses a modification of the TO-15 method to collect toxics VOC data. TO-15 is part of U.S.EPA's Compendium of Methods for the Determination of Toxic Organic Compounds in Ambient Air and consists of guidance for the sampling and analysis of volatile organic compounds in air. Ambient air is collected in a stainless steel canister in the field using either the Meriter MCS-1-R or the ATEC 2200 Air Toxic Samplers and analyzed using a GC/MS to determine the concentration of the compounds found in the sample obtained. Samples are collected for 24 hours on a 1/6 sampling schedule. Following are the 62 different VOCs currently being analyzed and reported:

Propene	Freon-12	Chloromethane	Freon-114
Vinyl Chloride	1,3-Butadiene	Bromomethane	Chloroethane
Ethanol	Acrolein	Acetone	Freon-11
Isopropanol	Vinylidene Chloride	Dichloromethane	Carbon Disulfide
Freon-113	t-1,2-Dichloroethene	1,1-Dichloroethane	Methyl Tert-Butyl Ether
Vinyl acetate	Methyl Ethyl Ketone	c-1,2-Dichloroethene	Hexane
Ethyl Acetate	Chloroform	Tetrahydro-Furan	1,2-Dichloroethane
1,1,1-Trichloroethane	Benzene	Carbon Tetrachloride	Cyclohexane
1,2-Dichloropropane	Bromodichloromethane	Trichloroethene	1,4-dioxane
Heptane	c-1,3-Dichloropropene	Methyl Isobutyl Ketone	t-1,3-Dichloropropene
1,1,2-Trichloroethane	Toluene	Methyl Butyl Ketone	Dibromochloromethane
1,2-Dibromoethane	Tetrachloroethene	Chlorobenzene	Ethylbenzene
m+p-Xylenes	Bromoform	Styrene	1,1,2,2-Tetrachloroethane
o-Xylene	p-Ethyltoluene	1,3,5-Trimethylbenzene	1,2,4-Trimethylbenzene
Benzyl Chloride	m-Dichlorobenzene	p-Dichlorobenzene	o-Dichlorobenzene
1,2,4-Trichlorobenzene	Hexachloro-1,3-butadiene	Total NMOC	

Monitoring Network

Indiana will operate nine sites. The current network, along with any changes planned in 2013, is listed in Table 20.

Network Modifications

Lafayette-Greenbush St. (181570008) will be relocated to Terre Haute. Emissions data and modeling will be used to find an advantageous location.

MONITORING METHOD: 126 - CRYOGENIC PRECONCENTRATION GC/FID DETECTION

Carbonyls

Monitoring Requirements

Carbonyl monitoring is required as one of the components of the PAMS monitoring program. The overall requirements are addressed in Table D-6 of 40 CFR Part 58 Appendix D. The specific requirement of monitoring for carbonyls at Indiana's PAMS site is listed in the approved PAMS network plan for the Chicago nonattainment area.

Monitoring Methodology

Carbonyl data are collected using Method TO-11A of the U.S.EPA's Compendium of Methods for the Determination of Toxic Organic Compounds in Ambient Air Compendium of Method. Currently Indiana uses the ATEC 2200 2C for 1/6 day sampling at Indpls - Washington Park (180970078) and the ATEC 8000 Automated Sampler for 1/6 day sampling at the Gary - IITRI (180890022) PAMS site. Samples are collected by drawing a known volume of air through a cartridge filled with silica gel coated with activated DNPH. These samples are analyzed using HPLC with a UV absorption detector.

Monitoring Network

Indiana currently operates two carbonyl monitoring sites. Gary - IITRI collects data for the Chicago PAMS network. Sampling at Indpls - Washington Park is conducted as part of Indiana's toxics network, and as parameters for the Indianapolis PAMS-like monitoring network. The details of the network are in Table 21.

Network Modifications

No changes are planned for the carbonyl monitoring network in 2013.

Figure 18 – Carbonyl Monitoring Network

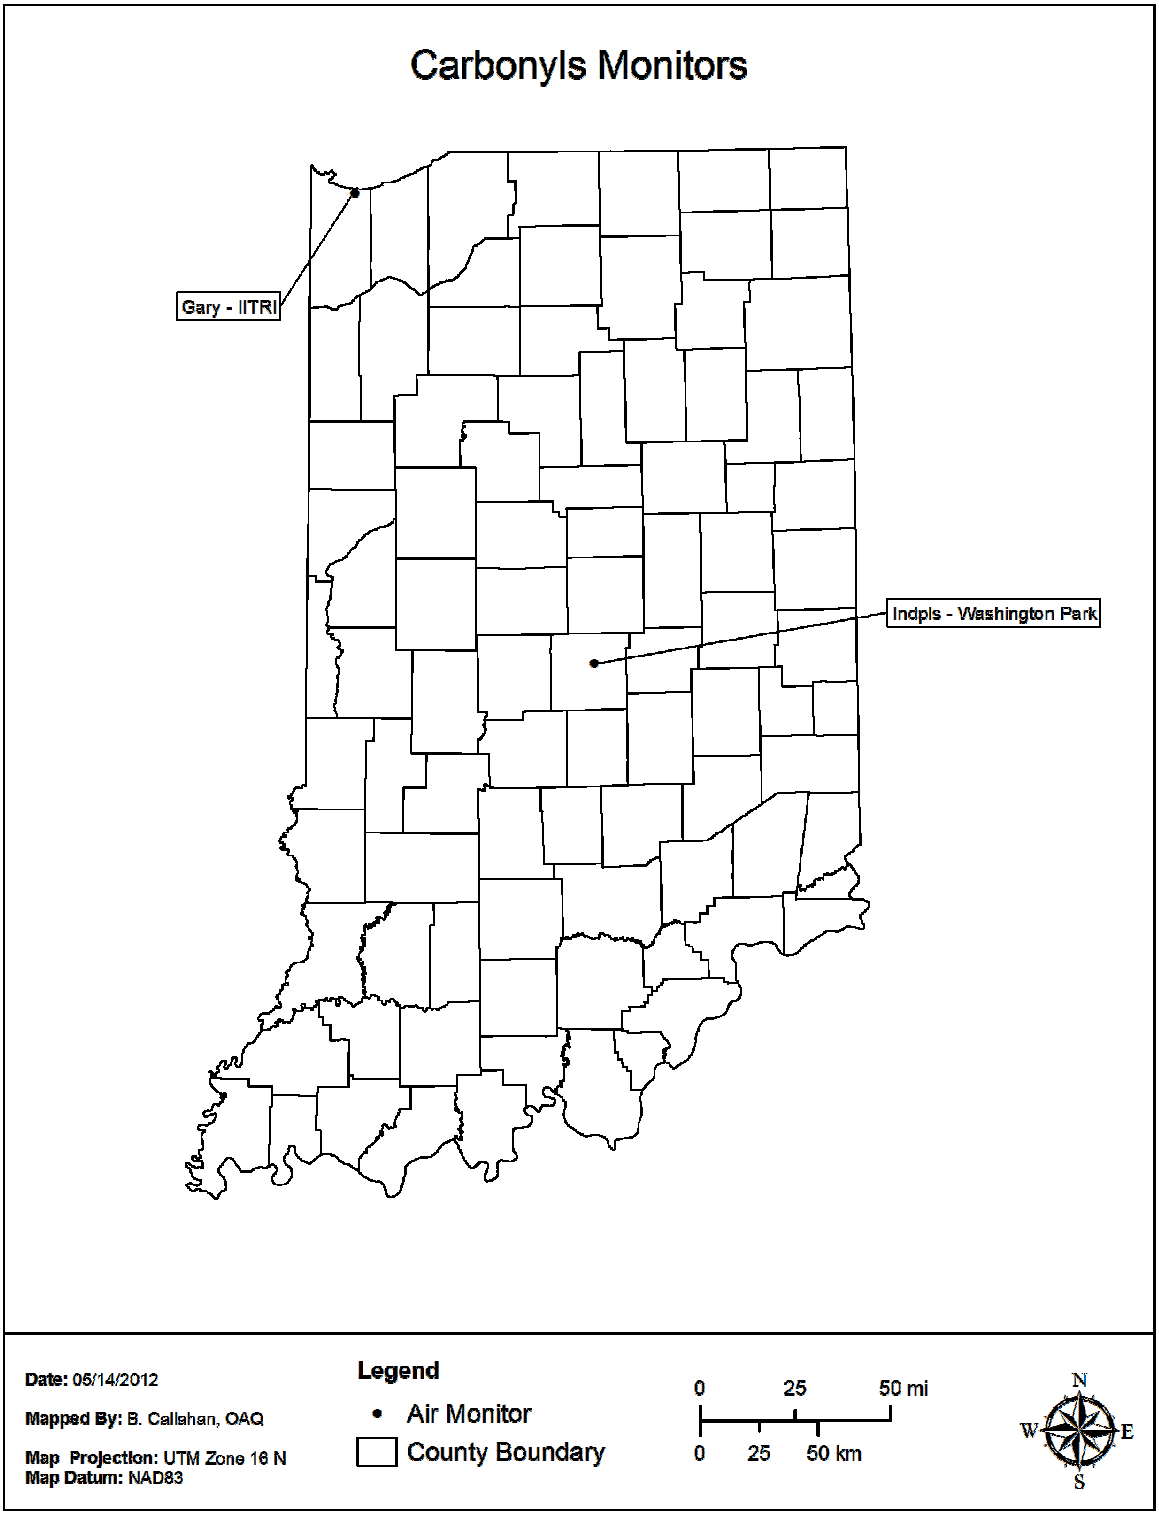

Table 21 – Carbonyl Monitoring Network

MONITORING METHOD: 102 - HPLC (TO-11A) DNPH-COATED CARTRIDGES

Metals

Monitoring Requirements

There are no requirements for metals monitoring listed in 40 CFR Part 58.

Monitoring Methodology

Metals data are collected using a TSP sampler and collecting the sample on filters for a 24-hour period according to a 1/6 day sampling schedule. Filters are analyzed using the flameless atomic absorption method.

Monitoring Network

There are six sites that monitor TSP metals in Indiana. Arsenic, beryllium, cadmium, chromium, lead, manganese, and nickel are monitored at Indpls - Washington Park (180970078). Due to concern over possible elevated manganese values reported in the School Air Toxics monitoring program in 2009, it was decided to analyze all the Pb samples collected in Lake and Porter Counties for manganese. These sites began reporting the additional metals data on January 2, 2010. These sites are detailed in Table 22.

Network Modifications

No changes are planned for the metals monitoring network in 2013.

Meteorological Monitoring

Monitoring Requirements

40 CFR Part 58 Appendix D, 3(b) specifies that the following meteorological parameters be measured for the design criteria for NCore sites; wind speed, wind direction, relative humidity, and ambient temperature. Meteorological monitoring is generally not required for SLAMS or NAMS sites; however these data support the suitability of the site along with other data sets. Many factors determine the amount and types of meteorological data that are collected in Indiana. Some of the factors include the intended use of the data and the availability of representative meteorological data that is already being collected by the National Weather Service in any given area of interest. Meteorological data are required to be collected at PAMS sites as per 40 CFR Part 58 Appendix D 5.1. This data will provide the ability to observe more accurately what the atmosphere is doing at the lower boundary layer.

Monitoring Network

Meteorological data are collected at 18 sites across Indiana in 2012. Sites are established to provide coverage in all areas of the state where pollutant monitoring is conducted. Table 23 details the meteorological sites and the parameters collected.

Network Modifications

The precipitation gauge at Indpls - E. 16th St. (180970073) will be relocated to Gary - IITRI (180890022). The original reason for the precipitation gauge at Indpls - E. 16th St. was to augment Indianapolis' visibility camera. However, the visibility camera is no longer operational and precipitation data is currently being collected at Indpls - Washington Park (180970078). Relocating the precipitation gauge will better correlate precipitation events and PM concentrations at the Gary – IITRI PAMS site.

The vertical and horizontal wind units at Mechanicsburg (180650003) will be replaced by one 3D ultrasonic wind unit. The 3D ultrasonic wind unit performs both functions of the two existing units at a higher rate of precision and accuracy.

Outdoor temperature and relative humidity will be added to Larwill (181830003) to support the urban scaled SO_2, and NO_x monitors.

NCore

Monitoring Requirements

40 CFR Part 58 Appendix D 3. requires each state to operate at least one NCore site and lists the minimum parameters which must be measured at that site. Currently the required parameters are continuous and intermittent $PM_{2.5}$, $PM_{2.5}$ speciation, $PM_{10-2.5}$ particle mass, CO, O_3, SO_2, NO/NO_y, lead, wind speed, wind direction, relative humidity, and ambient temperature.

Monitoring Network

Indiana's NCore site is Indpls – Washington Park (180970078). The details for all the NCore parameters are listed in Table 24. Except for $PM_{10-2.5}$, the parameters are also listed in the individual parameter sections.

Other parameters have also been collected at Indpls – Washington Park over the past 13 years. These are listed in Table 25, as well as in the individual parameter sections.

Network Modifications

No changes are planned for the NCore monitoring network in 2013.

Figure 21 – NCore Monitoring Network

Network Comments

Response to Comments

Comment #1
Received from Joanne M. Alexandrovich, Ph.D, Vanderburgh County Ozone Officer
e-mail submission on 6/28/2012

Dr. Alexandrovich submitted comments addressing the following areas:

1. Discontinued monitors and sites
   Dr. Alexandrovich is pleased that IDEM is attempting to replace the Evansville Post Office site. She is concerned that it has taken so long to find a replacement site. If a site is found, it is desired that a lead monitor be installed as well to document lead levels as the remediation of the Jacobsville Superfund Site progresses.
2. State Background Site
   Concern was expressed that the Plummer site would not provide true background concentrations. If the changes proposed in 2011 to Plummer, Oakland City, and SW Ag Center have not been completed, then it was suggested to continue to operate SW Ag Center concurrently with Plummer to determine the comparability of the data.
3. Boonville Ozone
   Dr. Alexandrovich noted that she was sorry to see that ozone would no longer be monitored at Boonville. She acknowledged that values are similar to other sites in the Evansville area and understood using the monitoring funds wisely. She thought that in Tables 1 and 7 it would be more appropriate to list Boonville as being discontinued and Columbus as being added instead of a relocation.
4. Columbus Site
   Dr. Alexandrovich questioned why IDEM intends to monitor NO2, ozone, PM2.5, and SO2 at Columbus and how long the monitoring would be conducted.
5. Continuous PM2.5
   Concern was noted with regard to using continuous PM2.5 monitoring data for compliance purposes. If IDEM plans to use the continuous data, the public should be notified and allow for public comment.
6. IDEM Leading Environmental Analysis and Display System (LEADS) data websites
   Dr. Alexandrovich appreciates the job that IDEM does monitoring the air quality around the state. She is frustrated that occasionally the posting of data from site(s) is interrupted and not available for use. She suggests that a note of some sort be posted to the site when data are not available.

Response

1. In 2011 when IDEM was notified that they would have to discontinue the site at the Post Office, the values from Evansville – Civic Center and its replacement site, Evansville - Post Office were compared to the data collected from the other sites in Evansville. Since the data were very close and IDEM had a difficult time finding the Evansville – Post Office site, it was proposed in the 2012 Network Plan not to replace the site. USEPA did not approve the discontinuation and requested that IDEM find a replacement site. Survey work was

conducted in December 2011 and January 2012 and two good sites were proposed. One organization decided they could not accommodate the sampling. The other property owner gave his approval and an agreement was proposed. No response to the agreement was received over several months' time. More survey work was conducted in May and a new site located at the new Rescue Mission on E. Walnut St. has been approved and work is progressing to set up the site and begin monitoring later this year.

IDEM does not plan to install a lead sampler at this site. A sampler was operated at the Evansville – Civic Center and Evansville – Post Office from 2001 through March 2011. This included the first phase of cleanup in the Jacobsville Neighborhood Superfund Site during 2010. The highest individual value obtained was 0.052 ug/m3 in 2004. The highest value recorded during the cleanup effort was 0.019 ug/m3. When comparing the data since 2008 with wind direction data, there is very little influence, if any, on the sampler from the cleanup area. Even with five or more hours of winds from the site, the majority of the values are 0.005 ug/m3 or less. Five of the seven values of 0.015 ug/m3 or more were not from the directions toward the neighborhood. Since calculations for the new NAAQS began in 2008, the 3-month design values have been either 0.00 ug/m3 or 0.01 ug/m3, well below the NAAQS of 0.15 ug/m3. With no values of any significant concentrations and the next phase of the remediation farther to the north and away from the new site, further monitoring is not warranted.

2. The discontinuation of Oakland City PM2.5 occurred at the end of 2011, as well as the relocation of the SW Ag Center site to Plummer, as indicated in Table 1 and 16. Oakland City had been a short term special study site to determine the values in the area and if there was any local influence from nearby sources.

3. The terms in the Tables 1 and 7 can be changed from 'relocated' to 'discontinue' and 'add.'

4. IDEM has been in the process of obtaining a PM2.5 monitoring site in Columbus, as indicated in last year's Network Plan. This was the only MSA in Indiana without a PM2.5 monitor. During this year's review the need for true background NO2 and SO2 data was brought forward by the air modeling staff of IDEM. These data would provide valuable input into models and analysis which are needed for new and existing source modeling and permits. In looking at the State, it was desired to have a site in the north and in the south. Larwill, north west of Fort Wayne, would serve as a northern site and somewhere in the mid south area, away from any major sources, would serve as the other. The Columbus area was chosen as a good candidate, and by locating to northeast of the city it would also serve the purpose as a downwind O3 site. Monitoring for SO2 and NO2 at the two sites will be performed for three years.

5. At this time IDEM will continue to collect continuous PM2.5 data at Evansville using the Met One 1020 Beta Attenuation Method Monitor. EPA has been working with the states to allow more time to gather data and get better agreement before they would be required to use the data. At the Air Monitoring Conference in May, Met One presented its commitment to understanding and correcting the problems that exist with their monitors. They are gathering information from all operators and making recommendations to correct field problems. In addition, there is a new software version due out this fall which is supposed to address the humidity issue. We will continue to work with Met One and USEPA to correct

any problems with IDEM's monitors and collect data which are acceptable for NAAQS purposes.
When IDEM is ready to use the continuous data for compliance purposes, it will be included in the Annual Network Review.

6. Idem appreciates Dr. Alexandrovich's comments regarding her appreciation of the job IDEM does at monitoring air quality across the state and making the data available to the public. LEADS does a very good job in obtaining the air quality data from the field and making it available to the staff and the public. But problems do arise with the system. We are also frustrated when this occurs. It can be the monitors themselves, the calibrators, the data collection system, communications, or the central system. Each morning the overall system is checked by two or more staff. Any issues found are addressed, either with the staff, the contractor, or IOT (Indiana Office of Technology). Staff have not always been aware of problems that have occurred only on the external posted data as they generally work on the internal site. More frequent reviews of the public pages will begin in the future.

   The most prevalent problem with the collection and posting of the data are communications issues. It is estimated that this accounts for 70% to 80% of the missing data. The wireless communications are usually interrupted and the routers need to be reset in the field. This problem should diminish in the future as we are able to get newer equipment. The 'LST' or 'LOST' data flag almost always indicates a communication issue. Currently the system will post 'LST' for 48 hours and then the site will not appear. Once communications are reestablished, the data are backfilled. With the new version of LEADS, to be online later this summer or early fall, the sites will not disappear from the posting, so the public will know that it should be a temporary situation.

   LEADS does not have an easy system for posting messages. The new version of LEADS will have an address for the public to send a message to the operators.
